

catalytic activity fraction (of an isozyme)

Quotient of the catalytic activity of the isozyme and the catalytic activity of all the isozymes of the same enzyme in the system.

Notes:

1. The term catalytic fraction is accepted for use in clinical chemistry.
2. The definition is based on the definitions of *catalytic activity* and *fraction*.
3. The definition also applies to other multiple forms of an enzyme that are not isoenzymes.
