

## **fermentation**

1. In *metabolism*, the dehydrogenating degradation of organic substance by organisms or cells under anaerobic conditions in which electrons are transferred to *metabolites* which accumulate and are excreted in reduced form. Fermentation is only possible if the organism is able to gain energy by this process.

2. In microbiology, the process in which cells (microorganisms, plant or animal cells) are cultured in a *bioreactor* in liquid or solid medium to convert organic substances into *biomass* (growth) or into products.
