

### **particulate carbon**

A *carbon material* consisting of separated monolithic particles.

Notes:

Distinctions should be made between coarse particulate carbon or *granular carbon* (larger than about 100  $\mu\text{m}$ , but smaller than about 1 cm in average size), fine particulate carbon or powder or flour (between 1  $\mu\text{m}$  and 100  $\mu\text{m}$  in average size) and *colloidal carbon* (below approximately 1  $\mu\text{m}$  in size in at least one direction), e.g. *carbon blacks* and colloidal carbon.
