## Dissolution Solutions

**K**nowing the physical properties of raw materials in all industries is crucial to accurately predict the behavior of a finished product. This is especially true with regard to pharmaceutical formulations and tablets. The particle size, surface area, porosity, and density of excipient products, such as magnesium stearate, and active ingredients should be closely monitored to ensure product performance. Oftentimes, small changes in the physical properties can cause a big shift in the dissolution rates. Micromeritics Analytical Services can help solve these problems by performing the tests and consulting with you to find the solution. A recent case study was documented and presented in a poster: Solutions for Dissolutions Poster.
